

DocAve[®]

Governance Automation Online

Release Notes

Service Pack 8, Cumulative Update 3

Issued December 2016

New Features and Improvements

- In the Office 365 User policy, you can now enable **Office Graph/Delve**, which allows that user's documents to be visible to others in Delve as well as the Discover view in OneDrive for Business.
- In the E-mail Settings, you can now add a custom Branding Logo and hide references to AvePoint in the e-mails sent to business users.
- In the site collection policy, you can now use **Access request** settings to determine request and invitation settings for all sites in the site collections where this policy is applied.
- In the Metadata Recertification, you can now enable adding or deleting metadata during metadata recertification process. You can also now add or delete metadata in the metadata recertification report via the ribbon.
- In a Create Group service, you can now add group classifications to new Office 365 groups created via this service.
- Added support for the **Assign by IT Admin** and the **Assign by Business User** options in the **URL** field of a Create Site Collection service, and in the **Library or List Address** field of a Create Library/List service.
- In an Office 365 User policy, you can now use the **DocAve Online Configuration** field and the **Enable Granular Backup for OneDrive for Business** site option to include the OneDrive for Business in a Granular Backup plan.
- Added support for appending the metadata that is collected from the Create User service and/or the Create Group service to the associated property bags of the OneDrive for Business and team site created by those services.

Known Issues

- When a business user starts a Clone or Transfer User Permissions service request, in the Source User field and/or the Target User field of the service request page, when the business user enters a public group name and/or a private group name and saves and submits the request, after an approver approves the request, an error task is generated. The system error message is occurs while cloning user permissions.
Root Cause: Cloning permissions and grating temporary permissions are based on DocAve Online. The public group and the private group are not supported in DocAve Online.
When you use the **Import Existing Site Collections and Sites** feature to import the following SharePoint Online built-in site collections: `.../portals/community` and `.../portals/hub`. These site collections cannot be imported to Governance Automation Online even if the Custom Script settings are enabled.
Root Cause: Governance Automation Online cannot update the property AllProperties of these site collections.
- Governance Automation Online cannot retrieve the last access time of site collections. Governance Automation Online retrieves the site collection's last modified time as the last

access time.

Root Cause: This issue is caused by SharePoint Online API limitation. SharePoint Online API does not have **GetSiteCollectionLastAccessDate**.

In the User Policy configuration page or Change Group Settings request page, an error page may appear and the task for applying user policy, creating Office 365 group, or changing Office 365 group settings may generate an error task with the following error message: **Processing data from remote server outlook.office365.com failed with the following error message.**

Root cause: Governance Automation Online manages User Policy and Office 365 groups via Exchange Online PowerShell. The error is related to Exchange Online PowerShell. The maximum number of open Exchange Online PowerShell connections for each tenant is three, which is the Office 365 limit. If the ongoing applications (including Governance Automation Online, DocAve Online, and other products) connect to Exchange Online PowerShell at the same time, and the number of connections exceeds three, this error will occur.

- When an IT Admin creates and saves a site template in SharePoint Online and the template file name contains special characters such as **tle@s't**, when a Create Site service > **Site Template**, the IT Admin selects the newly created site template, and the business user submits a request via this service, after an approver approves the request, an error task is generated. The system error message is **The selected site template is not supported for creating this type of site.**

Root Cause: When a custom template is retrieved from the SharePoint Online API, the SharePoint Online API will automatically filter out the template file whose file name contains special characters; therefore, the template file will not be returned in search results using the SharePoint Online API.

- In the **Service Permissions** field of a service, if an IT Admin chooses the **Select users or groups to use this service** option, enters an Office 365 group in the text box, and saves and activates the service then users within the entered Office 365 group will not be able to find this service in the **Start a Request** page.

Root Cause: The Office 365 group does not exist in AvePoint Online Services, but does exist in the Governance Automation Online database.

Work Around: Navigate to **AvePoint Online Services > Settings > User Management**, and add the Office 365 group as AvePoint Online Services users.

- After a request for a Create Site Collection service is completed using the **Select template later, Automatically enable Governance Automation Online App, and Automatically add the Site Information Card app part into the homepage** options, the site collection is created but the Governance Automation Online App and app part are not deployed to the site collection.
- When adding the Governance Automation Online App to a site collection or site, there is a **Select Installation Language** option in the **Do you trust Governance Automation Online** window. The language selected here does not take effect on the Governance Automation Online App because the display language of this app inherits the language of the site collection or site.
- There is no support for configuring questionnaires when accessing Governance Automation Online via Internet Explorer 8.

- When checking **members** in SharePoint Online, **members** and **All Users (membership)** are retrieved. The display names of **members** and **All Users (membership)** are in conflict. In SharePoint Online, different users or security groups can have a same display name, but Governance Automation Online can only use the display name that is the first selected, so **All Users (membership)** is used for the metadata value.
- Does not support configuring questionnaires when accessing Governance Automation Online via Internet Explorer 8.
- Governance Automation Online cannot retrieve the last access time of site collections. Instead, the site collection's last modified time will be the last access time.
- Root Cause: This issue is caused by SharePoint Online API. SharePoint Online API does not have "GetSiteCollectionLastAccessDate". Due to a SharePoint Online API limitation, Governance Automation Online retrieves the site collection **Last Modified Time** as the **Last Accessed Time**.
- Site size does not update in database when using Governance Automation Online to create a site. When you create a site, edit the site title and create a library/document in the site. In **Timer Service Configuration Management**, enable the site information synchronization job and modify the interval. After the site information is synchronized, the site size is not updated in the database.
- If you create a custom library template in SharePoint Online with **Include content** selected and then create a Library/List service for this custom library in Governance Automation Online, approving a **Create List/Library** request will create a library without content. This is due to a SharePoint Online API limitation.
- In the Create Site service, site collection URLs that contain **-public** in the Template store field will not be checked as valid. This is due to a SharePoint Online API limitation.
- The second stage approver is approved automatically when creating a two-stage approval process. In the first stage approval, set User1 and User2 as the approvers and the order is All at once (parallel). In the second stage approval, set an approver. Apply this approval process in a service and submit a request based on the service. In **All Tasks**, select the task for User1 and the task for User2, then click **Approve** on the ribbon to approve these two tasks. The task generated for the second stage approver is automatically approved.
- When viewing the Governance Automation Online expiration notification e-mail via Windows Mail, the e-mail content and the pictures are not displayed properly. When you use Internet Explorer 9 to access Office 365 Outlook, the pictures within the e-mail are not displayed properly.
- If the title of a site is modified after the built-in site groups have been created, the site group names will not match the modified site name because the prefix of the built-in groups is still the original site title.
- When a business user starts a **Clone or Transfer User Permissions** service request, if they enter a public group name and/or private group name in the **Source User** field and/or the **Target User**, the system will generate the following error message: **An error occurred while cloning user permissions**. Cloning permissions and granting temporary permissions are based on DocAve Online. The public group and the private group are not supported in DocAve Online.

- If an IT Administrator assigns a group to be the additional site collection administrators and selects **Only allow site collection contacts or site collection administrators to submit requests for this service**, when a user of that group submits a **Change Site Collection Settings** service, a **Change Site Metadata** service, a **Change Permissions** service, a **Site Collection Lifecycle Management** service, or a **Site Lifecycle Management** service, the following message appears: **We're sorry... Only the site contact or site collection contact can submit this request**. The group specified as the additional site collection administrator group is retrieved from SharePoint Online, but the **SPObjectId** property of the group cannot be retrieved; therefore, whether or not the user who submitted the request belongs to this group is unknown.
- If the Governance Automation Online App is deployed to two site collections separately and a **Content Move** request to copy one site collection to the other site collection is made with conflict resolution set to overwrite, after the task is approved and completed, the DocAve Governance Automation Online link on the quick launch produces an error page when clicked.
- If both the Deployment Manager and the Governance Automation Online App automatic deployment features are enabled on a **Create Site Collection** service and the source scope of a Deployment Manager plan contains the Governance Automation Online App, when the **Create Site Collection** services is used the newly created site collection will have two links for the Governance Automation Online App. One link redirects to the Governance Automation Online App interface and the other link brings produces an error page.
- If the **Import Existing Site Collections and Sites** feature is used to import the following SharePoint Online built-in site collections **.../portals/community** and **.../portals/hub**, they cannot be imported to Governance Automation Online even if the Custom Script settings are enabled. Governance Automation Online cannot update the **AllProperties** property of these site collections.
- When configuring an e-mail template, a reference in the message body cannot be replaced with real data if the reference is copied from another e-mail template, rather than being added with **Insert Reference**.
