

# Release Notes

**Product: DocAve® 5.1.2.0**

**Release Date: Feb. 25<sup>th</sup>, 2009**

**Package List:** Patch Packages (Manager and Agent); Demo Packages (Manager and Agent)

## Bug Fixes

### Data Protection

- **Platform Level Backup Data Availability**

An error occurred in the previous version where Platform Level backup data would not appear when the associated backup Agent was down.

### Administration

- **Optional Workflow Option**

After modifying a scheduled plan, the next backup cycle would always run a full backup, regardless of what was selected. This has been remedied and the plan will now run with the appropriate backup type when incremental or differential is selected.

- **Replication of Content with the Same URL**

Replication of sites with the same URL across multiple farms was not supported by the selection logic of the mapping trees. This has been resolved.

### General

- **Tree Sorting Issue**

The SharePoint trees of several modules were not loading properly due to a sorting issue for URLs. This has been resolved.

- **DocAve Application Database on SQL Connection Issue**

When selecting the SQL Database for the DocAve application database option on installation, a "connection refused" network error occasionally occurred. This has been resolved.

## Known Issues

### Migration

- **File System Migration using Excel-based Metadata Configurations**

For users who are importing content in the DocAve File System Migrator using the "Excel File" metadata mode (where the metadata is read from a previously configured metadata file designed in excel), Windows Server 2008 is not currently supported.

## **General**

- **SSL Support for Command Line Interface Features**

If you are currently using SSL communication between your DocAve Manager and Agents, you will need to restart the manager services to support the High Availability or Deployment Manager CLI interfaces (go to the Manager Configuration Tool and click "confirm").
